

Principles of renewable energy conversion

Course author: prof. dr hab. inż. Janusz Cieśliński (WM)

Contents

1. Modelling of solar heat absorption
 - 1.1. Spectral distribution of extraterrestrial solar irradiance
 - 1.2. Atmosphere absorption and related effects
 - 1.3. Heat balance of a flat plate collector
 - 1.4. Heat balance of an evacuated collector
 - 1.5. Energy balance for drying
 - 1.6. Energy balance of a solar still
2. Modelling of wind energy extraction
 - 2.1. Characteristics of the wind
 - 2.2. Weibull, Rayleigh and chi-squared distributions
 - 2.3. Betz model of expanding gasstream
 - 2.4. Power extraction by a turbine
3. Hydro-power
 - 3.1. Energy balance for a streamtube
 - 4.2. Conservation of momentum
4. Ocean energy
 - 4.1. Power extraction from waves
 - 4.2. Basic theory of tidal power
 - 4.3. Thermodynamic principles of OTEC

5. Geothermal energy
 - 5.1. Modelling of heat extraction from the rock
 - 5.2. Modelling of heat extraction from hot aquifers
6. Thermal energy storage
 - 6.1. The infinite heat capacity model
 - 6.2. Modelling of the transient response of the selected storage units
